Getting connected

Paradigm Communications has recently launched the Connect100T, a low-cost, transportable, multi-service terminal developed for use on the Global Xpress service, the global network which provides users with high-speed Ka-Band satellite communications. The Connect100T is easy to assemble and deploy and provides twice the performance of other Global Xpress terminals, at half the cost. Paradigm's range of Global Xpress land terminals are designed specifically for use in tough environments and have been in demand by government, NGO and commercial organisations since shipping began in early 2015.

Robust communications for small crafts

Drumgrange's Diamond Intercom and Radio Combiner System has been developed specifically for use on small, high speed craft and incorporates a user-friendly ergonomic design for single-handed operation in high-speed transit. Diamond provides crew members with independent access to secure and non-secure communication networks, uninterrupted intercom facilities (VOX) and full control of voice-activated communication. The intuitive modular and robust design allows for simple, easy operation in the harshest of conditions and maintenance is straightforward - module replacement can be made with no need for complicated diagnostic equipment. It's an ideal solution for coast guard, small boat patrols and Special Forces.

Rugged routers from Elma

Elma Electronic, the Swiss-based global manufacturer of electronic packaging products for the embedded systems market, is launching a range of rugged routers. This range utilises Cisco's certified rugged, mobile routing

and switching along with the packaging and integration know how of Elma Electronic. As board technology advances there is an increasing demand for smaller processing and routing systems for deployed applications, and so this year they will also release a family of application-ready embedded computers for deployed and rugged applications.
